

ABSTRACT

A stool marker formulation for oral administration and suitable for use in CT
Colography including a material adapted to provide marked stool which has a modified
5 response to radiation relative to unmarked stool.

Radiologically scanning the colon of a patient treated to produce marked stool
produces data which can be manipulated to provide a representation of the colon including
where present, a polyp.

The active ingredient is preferably barium sulfate which has been destabilised to
10 reduce its resistance to flocculation.
